

PHYS 2C

Discussion Section – 1/07

TA: Bharat Kambalur

Email: bkambalu@ucsd.edu

Before we Begin:

- Try and **sit next to a student you don't know**
- Introduce yourselves and find out where the other student is from
- We will work through 3 Problems today,
in groups of two students first and then discuss the solution

About Me

- From **Bangalore, India**

Discussion Problem 1

Exercise Problem 12 – Chapter 14 - Textbook

The container shown here, is filled with oil ($\rho_{oil} = 900 \text{ kg} \cdot \text{m}^{-3}$).

It is open to the atmosphere on the left.

- What is the pressure at point A?
- What is the pressure difference between points A and B? Between points A and C?

Discussion Problem 1- Solution

Exercise Problem 12 – Chapter 14 - Textbook

The container shown here, is filled with oil ($\rho_{oil} = 900 \text{ kg} \cdot \text{m}^{-3}$).

It is open to the atmosphere on the left.

- What is the pressure at point A?
- What is the pressure difference between points A and B? Between points A and C?

106 kPa

4.4 kPa

Discussion Problem 2

Estimate Density of Glycerin

The figure shows a column of Glycerin suspended in a glass tube.

Assuming the apparatus is at sea level, estimate the density of Glycerin.

Discussion Problem 2 - Solution

Estimate Density of Glycerin

The figure shows a column of Glycerin suspended in a glass tube.

Assuming the apparatus is at sea level, estimate the density of Glycerin.

$$\rho_{Glycerin} = 1260 \text{ kg} \cdot \text{m}^{-3}$$

Discussion Problem 3

Hydraulic Jack

You are working on your own car, which weighs 1800 kg. You want to rotate the tires, for which you need to lift the car off the ground.

Suppose you use a Hydraulic jack with the large cylinder radius = 15cm and a small cylinder radius = 6cm.

Assume: The working fluid is water and h (in diagram) is 0

- a) What is the minimum force needed (in kg-f) on the smaller cylinder in order to lift the car?
- b) Suppose you want to move the car up by 50cm, how much distance should the small piston be moved down?

Discussion Problem 3 - Solution

Hydraulic Jack

You are working on your own car, which weighs 1800 kg. You want to rotate the tires, for which you need to lift the car off the ground.

Suppose you use a Hydraulic jack with the large cylinder radius = 15cm and a small cylinder radius = 6cm.

Assume: The working fluid is water and h (in diagram) is 0

- a) What is the minimum force needed (in kg-f) on the smaller cylinder in order to lift the car?
288 kg-f
- b) Suppose you want to move the car up by 50cm, how much distance should the small piston be moved down?
3.125m (or 312.5 cm)
